

Tirai — go-to-market plan

How a confidential RFQ desk gets its first real trade, its first paying venue, and its first ten desks.

HackCanton Season #2 · Financial Applications · solo builder: Pugar Huda Mantoro · repo github.com/PugarHuda/tirai · live desk tirai.vercel.app

POSITIONING

For institutional trading desks that move blocks in tokenised assets, **Tirai** is the confidential RFQ/OTC venue that lets them get a competitive price without telling the market they are trading — **unlike** public order books and AMMs, which leak size and direction before the trade prints, and **unlike** voice/chat trading, which leaks nothing but also settles nothing.

The one sentence a trader remembers: "You whisper quotes; the market hears nothing — and the regulator still gets the whole record."

The three proof points, in the order they land: (1) dealer B's node never receives dealer A's quote — verifiable on-ledger, not a UI promise; (2) settlement is atomic DvP with a real cETH/CBTC cash leg, so nobody carries counterparty risk; (3) best execution is provable after the fact without ever having been public.

BUSINESS MODEL

- **Per-trade venue fee** in the settlement asset — basis points of notional, taken atomically inside the settlement transaction. No invoicing, no collection risk: if the trade settles, the fee is paid.
- **Network rewards.** Featured-app activity markers (CIP-0047) accrue on every settlement, so a live desk earns from the volume it clears in addition to the fee.
- **Revenue share with the hosting venue** — the venue brings the client relationship and custody, Tirai brings the primitive; the fee splits.
- **Not** a per-seat licence. Institutional desks resent seat pricing, and it decouples our revenue from the thing we actually improve: executed volume.

CHANNELS, IN PRIORITY ORDER

Channel	Why it works	First action
Asset-issuer ecosystems — onRails (cETH), BitSafe (CBTC)	They need trading venues for their asset to be worth holding; we need their registry and their holders. Mutual, not a favour	Settle live test-token trades, then ask to be listed as an app in their ecosystem materials

Hosting venues & wallets — Temple, Bron, Console, Canton Loop	They already hold the institutional relationship, the custody and the onboarding; we are a feature they cannot build in a week	Ship as an embeddable app with the standard AllocationRequest flow — their wallet already renders it, so integration is small
Canton Network ecosystem — Canton Foundation, Digital Asset, validator operators, CIP process	Distribution to exactly the institutions building on Canton; the privacy story is the network's own pitch, demonstrated	Hackathon submission, then a written case study of the privacy verification with reproducible numbers
Direct desk outreach — crypto-native funds and prop shops first	Short decision chains: a CIO can say yes to a pilot in one meeting	Warm intros from the ecosystems above; demo on live Devnet state, not slides
Agent / MCP distribution	The desk is already exposed as MCP tools, so an institutional agent stack can read the market and post RFQs without a human UI — a channel nobody else in this category has	Publish the MCP server and one worked agent example

90-DAY PLAN

Days 0–30 — make it real

- Wire the onRails cETH registry end to end (off-ledger choice context, disclosed contracts) and settle live test-token trades; repeat for BitSafe CBTC.
- Publish the privacy verification as a reproducible artefact: anyone can run the check against the live ledger and get the same answer.
- Recruit **one** design-partner desk and a panel of 3–5 dealers it already faces bilaterally.

Days 30–60 — one venue, one instrument class

- Land one hosting venue integration; agree the fee split and the activity markers.
- Run the design partner on a single instrument class in shadow mode: real RFQs, real quotes, settlement compared against their existing execution.
- Instrument everything the desk cares about — fill quality vs. their current venue, time-to-quote, panel response rate.

Days 60–90 — evidence, then repeat

- Turn on the venue fee for live trades at the pilot desk.
- Publish the pilot's execution-quality numbers (with the desk's permission) — the only marketing that moves institutions.
- Use that reference to open the next three desks through the same venue.

SUPPORTING MATERIALS (ALL LIVE TODAY)

- **Working product** — hosted read-only desk at tirai.vercel.app over real Canton Devnet state; a prospect can look at live contracts, not a mock-up.
- **Public repository** — github.com/PugarHuda/tirai: model, tests, CI, deployment scripts, and a build journal that shows the work rather than claiming it.
- **Reproducible privacy proof** — an on-ledger check that fails the build if a quote ever leaks; the strongest sales asset we have, because a prospect can run it themselves.
- **Value statement and ICP documents**, this plan, and a demo video walking through a real settlement.
- **MCP server** — six tools, so an evaluating team can point their own agent at the desk during diligence.

RISKS AND HOW WE HANDLE THEM

- **Cold-start liquidity.** An RFQ desk with one dealer is worthless. Mitigation: launch inside a venue that already has the dealers, and start with panels that already trade bilaterally — we digitise an existing relationship rather than creating a new market.
- **Long institutional sales cycles.** Mitigation: beachhead with crypto-native desks whose decision chain is one person, and use their numbers to open the slower doors.
- **Registry dependency.** The cash leg needs a live registry. Mitigation: the instrument is any {admin, id}, so cETH, CBTC, Canton Coin and USDCx are one code path — no single issuer can strand us.
- **Regulatory ambiguity around dark trading.** Mitigation: the regulator role is built in, not bolted on — post-trade visibility by default and selective pre-trade disclosure on demand.

WHAT WE ARE ASKING FOR

cETH and CBTC Devnet test tokens to complete live settlement; an introduction to one hosting venue willing to pilot an embedded app; and one design-partner desk trading a tokenised instrument in size.

Tirai — Indonesian for "curtain". Price discovery happens behind it. You whisper quotes; the market hears nothing.
