

CANTON BUILDERS OFFICE HOURS · 2 SEPTEMBER 2026

tirai.

The confidential multi-dealer RFQ desk, built native on Canton. Sealed quotes, atomic delivery-versus-payment, provable best execution.

You whisper quotes. The market hears nothing.

Asking for a price **is** the information

An institution wants to move a block of bonds. Before it can trade, it has to ask several dealers what they would pay.

**The moment anyone sees you asking,
they know your size and your direction.**

FOUR STEPS, AND THE MARKET SEES NONE OF THEM

A panel you choose. Answers nobody else hears.

01 · ENQUIRE

The buyer invites a panel

Two, three, five dealers — chosen by the buyer. The request reaches their nodes and no others.

02 · QUOTE

Each answers sealed

Quoting moves that dealer's bond into escrow. A price is a commitment, not a bluff.

03 · AWARD

Cheapest wins, second price paid

So shading your quote costs you deals without ever improving your margin.

04 · SETTLE

One transaction, both legs

Bond and cash move together, or neither moves. No settlement window.

Two dealers. One has priced. The other's node was never told.

Dealer A DealerA-9b3970be	Dealer B DealerB-4f1df03a
Incoming RFQs RFQ · TBOND30 you have quoted (sealed) qty 1,000	Incoming RFQs RFQ · TBOND30 Ask (USDC) qty 1,000 Whisper sealed quote
Your quotes (rivals can't see these) 1 · Dealer A seals 4,210,000 your quote 4,210,000 TBOND30 · 1,000 · sealed to buyer only ⚠️ Disclose to regulator (fair-pricing defence) Withdraw quote (release escrow)	Your quotes (rivals can't see these) You only ever see your own quotes. Rival dealers' quotes are never sent to your node. 2 · Dealer B's own node – nothing arrived

Left: Dealer A, having sealed 4,210,000. Right: Dealer B's own session, at the same moment, reading its own participant node. Not a masked row. Not a commitment hash waiting to be revealed. Nothing.

JASON SAID ABOUT FORTY LINES OF DAML. HONESTLY, THIS PART IS TWO.

The privacy is a **declaration**, not a mechanism

```
template Quote
  with
    regulator : Party
  ...
  where
    signatory dealer, buyer
    -- and nothing else. No observer clause.
```

The regulator's party id is a field on that contract — and the regulator still cannot see it. Being *named* in a contract is not being a *stakeholder* in it.

No third party to hide from,
so **nothing to encrypt**.

A price you cannot walk away from — and an auction that cannot be talked down

DealerA-9b3970be
TBOND30 · 1,000

4,210,000 USDC

Accept · direct OTC (pay ask 4,210,000)

Partial fill

1000.0000000000

Fill partial (prorated)

1 · the bond is held, not promised (on audit)

Reject quote (return escrow)

2 · one quote, no second price — refused

Only one dealer has quoted, so there is no auction to run — no second price exists, and the ledger refuses an award that would quietly pay this dealer its own ask under a Vickrey label. Hit the ask directly with **Accept · direct OTC**, which settles at 4,210,000 and is recorded as the direct trade it is.

Escrow on quote. Submitting a price moves that dealer's bond into escrow before the buyer ever sees the number. An indication is free, and anything free gets abused in a sealed auction — quote aggressively everywhere, decide later whether to honour it. Here the buyer never awards into a bluff, and the dealer is never left holding a counterparty who changed their mind.

And the worst bug I have shipped. With one quote there is no second price. Awarding used to fall back to the winner's own ask — first price wearing a Vickrey label, chosen *after* the buyer had seen every sealed number, with the dropped quote never revealed to anyone.

The ledger refuses it outright now. A buyer who wants to lift an ask uses the direct rail, where it is recorded as the direct trade it is. The regression test is named after the bug.

Don't trust the demo. Count the nodes.

✓ Sub-transaction privacy verified on-ledger

Dealer A's node holds **1** sealed quote(s) — all **1** its own. Rivals' quotes received: **0**.

1 · its own quote, and no rival's

Dealer B's node holds **1** sealed quote(s) — all **1** its own. Rivals' quotes received: **0**.

2 · the same, from the other side

Regulator's node holds **0** settled trade(s), **0** sealed quotes, **0** live RFQ(s). Pre-trade visibility: **none**.

3 · the regulator sees nothing yet

Each figure is the number of contracts that party's participant node actually holds — queried live over the JSON Ledger API, not filtered by this UI. A rival dealer's quote isn't hidden from the screen; it was never transmitted to that node. That is Canton sub-transaction privacy — no ZK proofs, no FHE, no TEE.

One read per party, addressed to that party's node, counting what came back. Four reads, four parties, four different answers — visible in your own devtools. The claim is checkable from your side of the screen, not mine.

Provable best execution, with no public book

A public exchange audits best execution against a visible order book. Tirai has no public book — pre-trade stays confidential — yet the regulator still proves it, by checking the executed price against the sealed asks the counterparties chose to disclose to it. **Confidential pre-trade, provable post-trade.**

1 · the verdict, computed not asserted

✓ best execution attested

TBOND30 · 1,000 @ 4,250,000 (4,250/unit)

DEALER — DISCLOSED SEALED ASK	ASK	PER UNIT	VS CLEARING
DealerA-9b3970be winner	4,210,000	4,210	lowest ask ✓
DealerB-4f1df03a	4,250,000	4,250	≥ clearing ✓

2 · winner quoted lowest; buyer paid the runner-up

the buyer cleared at the runner-up's price — the sealed Vickrey second price. No disclosed dealer offered better than the executed price.

A public exchange proves best execution against a visible order book. There is no book here. Either side can reveal a sealed ask to the regulator on demand — without ever showing a rival — and the executed price is checked against it. Confidential before the trade, auditable after it.

“What if I’m an invited dealer, and I front-run you?”

DEALER	INVITED	ANSWERED	RESPONSE	WON	AVG FROM WINNER	BEHIND FIRST	PULLED
DealerA-9b3970be	1	1	100%	1	0 bps	0s	—
DealerB-4f1df03a	1	1	100%	0	+95.0 bps	4s	—

1 · distance in bps — never the losing ask

Counted over 1 awarded auction. **Avg from winner** is how far this dealer's ask sat above the winning ask, in basis points — the record keeps the distance, never the ask itself, so a losing price stays unrevealed even here. **Behind first** is how long after the auction's quickest responder it sealed. A dealer invited is the only place that behaviour is visible at all: it leaves no contract of its own.

2 · and silence is the only thing it cannot hide

An invited dealer does see the enquiry, and no ledger stops that. What changed: every award now writes a record the buyer keeps — who was invited, who answered, and how far each ask was from the winner's *in basis points, never the ask itself*. A losing price stays unrevealed even in the buyer's own record. A dealer who takes the look and never prices is on the ledger, timestamped, attributable.

What is running, and what I **won't** claim

DAML TEST SCRIPTS GREEN

Cash legs settle through registries I neither control nor can mint into. Shipped as a package upgrade — the validator runs 0.1 through 0.5 side by side.

BUILT, BUT LIMITED

No fee on a registry rail

Those settle by issuer allocation, not by splitting a holding I hold. cETH still waits on a token grant.

NOT YET TRUE

No design partner, no revenue

The trading history was seeded by me to exercise the flows. It is not customer volume, and I won't present it as any.

IF SOMEONE HERE CAN MAKE ONE INTRODUCTION

One desk. Ten enquiries. Ninety days.

A dealer, a desk, or a fund administrator that runs block enquiries over chat today – and will put ten of them through this and tell me where it breaks. Not a contract. Ten enquiries.

I have written down where I stop: **two quiet weeks, or one quote visible to a rival**, and the pilot ends there.
